

# Factoring into coprimes

D. J. Bernstein

University of Illinois at Chicago

Does  $91^{1952681} 119^{1513335} 221^{634643}$   
equal  $1547^{1708632} 6898073^{439346}$ ?

Each side has logarithm  
 $\approx 19466590.674872$ .

Which integers  $(a, b, c, d, e)$  satisfy  
 $91^a 119^b 221^c = 1547^d 6898073^e$ ?

$$91 = 7 \cdot 13; 119 = 7 \cdot 17;$$

$$221 = 13 \cdot 17; 1547 = 7 \cdot 13 \cdot 17;$$

$$6898073 = 7^4 \cdot 13^2 \cdot 17.$$

$$(a, b, c, d, e) \mapsto$$

$$91^a 119^b 221^c 1547^{-d} 6898073^{-e} = \\ 7^{a+b-d-4e} 13^{a+c-d-2e} 17^{b+c-d-e}.$$

Kernel is generated by

$(1, 1, 1, 2, 0)$  and  $(3, 2, 0, 1, 1)$ .

## General algorithm

Given integers  $e_1, \dots, e_k$

and positive integers  $s_1, \dots, s_k$ :

$s_1^{e_1} \cdots s_k^{e_k} = 1$  if and only if

$e_1 \text{ ord}_q s_1 + \cdots + e_k \text{ ord}_q s_k = 0$

for all primes  $q$  dividing  $s_1 \cdots s_k$ .

Problem: Often difficult to find  $q$ 's.

Solution: Find coprime base  $P$   
for  $\{s_1, \dots, s_k\}$  with  $1 \notin P$ .

Coprime means  $\gcd\{q, q'\} = 1$   
for all  $q, q' \in P$  with  $q \neq q'$ .

Base means each  $s_j$  is a product  
of powers of elements of  $P$ .

Then  $s_1^{e_1} \cdots s_k^{e_k} = 1$  if and only if  
 $e_1 \text{ord}_q s_1 + \cdots + e_k \text{ord}_q s_k = 0$   
for all  $q \in P$ .

Can find coprime base  
by iterating  $(a, b) \mapsto (a/g, g, b/g)$   
where  $g = \gcd \{a, b\}$ .

1547	6898073
1 1547	4459
1 17 91	49
1 17 1 91	49
1 17 1 13 7 7	
1 17 1 13 1 7 7	
1 17 1 13 1 1 7 1	

$$\text{cb} \{1547, 6898073\} = \{17, 13, 7\}.$$

Can factor  $S$  into coprimes  
in quadratic time.

(Bach, Driscoll, Shallit 1990)

- Given  $a, b$ : compute  $\text{cb} \{a, b\}$ .
- Given  $a, Q$ , with  $Q$  coprime:  
compute  $\text{cb}(\{a\} \cup Q)$ .
- Given  $S$ : compute  $\text{cb } S$ .
- Given  $S, P$ : factor  $S$  using  $P$ .

# An example of factor refinement:

Given squarefree  $g \in (\mathbf{Z}/2)[x]$ .

Want to factor  $g$ .

One way: Find basis  $h_1, h_2, \dots$

for  $\{h \in (\mathbf{Z}/2)[x] : (gh)' = h^2\}$ .

Then cb  $\{g, h_1, h_2, \dots\}$  contains  
all irreducible divisors of  $g$ .

(Niederreiter 1993)

# Ideal arithmetic in number rings

Monic irreducible  $\varphi \in \mathbf{Z}[x]$ .

Want to handle ideals of  $\mathbf{Z}[x]/\varphi$ .

Represent ideal  $M$  as

$\{\mathbf{Z}_q M : q \in P\}$  with  $P$  coprime.

Compress  $\mathbf{Z}_q M$  as if  $q$  were prime.

(Bernstein)

## Fast arithmetic

In time  $O(n \log n \log \log n)$   
can multiply  $n$ -digit numbers.  
(Schönhage, Strassen 1971)

Or divide  $n$ -digit numbers.  
(Cook; Sieveking; Kung; Brent)

In time  $O(n(\log n)^2 \log \log n)$   
can find gcd of  $n$ -digit numbers.  
(Lehmer; Knuth; Schönhage)

Need more for fast cb:

5	48828125
1 5	9765625
1 1 5	1953125
1 1 1 5	390625
1 1 1 1 5	78125
1 1 1 1 1 5	15625
1 1 1 1 1 1 5	3125
1 1 1 1 1 1 1 5	625
1 1 1 1 1 1 1 1 5	125
1 1 1 1 1 1 1 1 1 5	25
1 1 1 1 1 1 1 1 1 1 5	5
1 1 1 1 1 1 1 1 1 1 1 5 1	

If  $a = 5^e$  and  $b = 5^f$  then  
 $\text{cb}\{a, b\} = \{5^{\gcd\{e, f\}}\} - \{1\}$ .

$(a/g, g, b/g)$  for  $g = \gcd\{a, b\}$  is  
 $(5^{e-f}, 5^f, 1)$  or  $(1, 5^e, 5^{f-e})$ .

$(e, f) \mapsto (e - f, f)$  or  $(e, f - e)$   
is Euclid's original gcd algorithm.  
Sometimes very slow.

Better: Subtract  $2^j f$  from  $e$   
if  $e$  is between  $2^j f$  and  $2^{j+1} f$ .

Can do this to exponents  
with fast combination of  
multiplication, division, gcd.

For example:  $\min \{e, 64f\}$  from  
 $c_1 = \gcd \{a, b^2\}$ ,  $c_2 = \gcd \{a, c_1^2\}$ ,  
 $c_3 = \gcd \{a, c_2^2\}$ ,  $c_4 = \gcd \{a, c_3^2\}$ ,  
 $c_5 = \gcd \{a, c_4^2\}$ ,  $c_6 = \gcd \{a, c_5^2\}$ .

Given coprime sets  $P, Q$ ,  
to quickly compute  $\text{cb}(P \cup Q)$ :

Replace  $Q$  with  $Q'$  such that  
 $\text{cb}(P \cup Q) = \text{cb}(P \cup Q')$ ;  
 $Q'$  has  $O(n \log n)$  digits;  
and  $Q'$  has  $O(\log n)$  elements.

Insert  $Q'$  one element at a time.

If  $Q = \{q_{00}, q_{01}, \dots, q_{15}\}$  then  
 $Q' = \{q_{00}q_{02}q_{04}q_{06}q_{08}q_{10}q_{12}q_{14},$   
 $q_{01}q_{03}q_{05}q_{07}q_{09}q_{11}q_{13}q_{15},$   
 $q_{00}q_{01}q_{04}q_{05}q_{08}q_{09}q_{12}q_{13},$   
 $q_{02}q_{03}q_{06}q_{07}q_{10}q_{11}q_{14}q_{15},$   
 $q_{00}q_{01}q_{02}q_{03}q_{08}q_{09}q_{10}q_{11},$   
 $q_{04}q_{05}q_{06}q_{07}q_{12}q_{13}q_{14}q_{15},$   
 $q_{00}q_{01}q_{02}q_{03}q_{04}q_{05}q_{06}q_{07},$   
 $q_{08}q_{09}q_{10}q_{11}q_{12}q_{13}q_{14}q_{15}\}.$

Can compute  $\text{cb } S$  given  $S$   
in time  $n(\log n)^{O(1)}$ .

Given coprime base  $P$  for  $S$ ,  
can factor  $S$  over  $P$   
in time  $n(\log n)^{O(1)}$ .

Same for any ~~freakoid~~ free coid  
with fast arithmetic.

(Bernstein)

## Decomposing perfect powers

Given integer  $c > 1$  with  $c < 2^n$ .

Want largest integer  $k$   
such that  $c$  is a  $k$ th power.

Find integer  $r_k$  within 0.9 of  $c^{1/k}$   
for  $1 \leq k < n$ .

Can check if  $(r_k)^k = c$  for each  $k$   
in total time  $e^{O(\sqrt{\log n \log \log n})} n$ .

(Bernstein)

Time  $n(\log n)^{O(1)}$  using  
fast factorization into coprimes:

Compute  $P = \text{cb} \{r_1, r_2, \dots\}$ .

$c$  is a  $k$ th power if and only if  
 $k$  divides  $\text{ord}_q c$  for each  $q \in P$ .

Largest  $k$  is  $\gcd \{\text{ord}_q c : q \in P\}$ .

(Lenstra, Pila)
