

Elliptic vs. Hyper- elliptic

Part III

D. J. Bernstein & T. Lange

<http://hyperelliptic.org/tanja/newelliptic>

- p. 1

Elliptic strikes back

To face the challenge, to take the competition to a completely new level

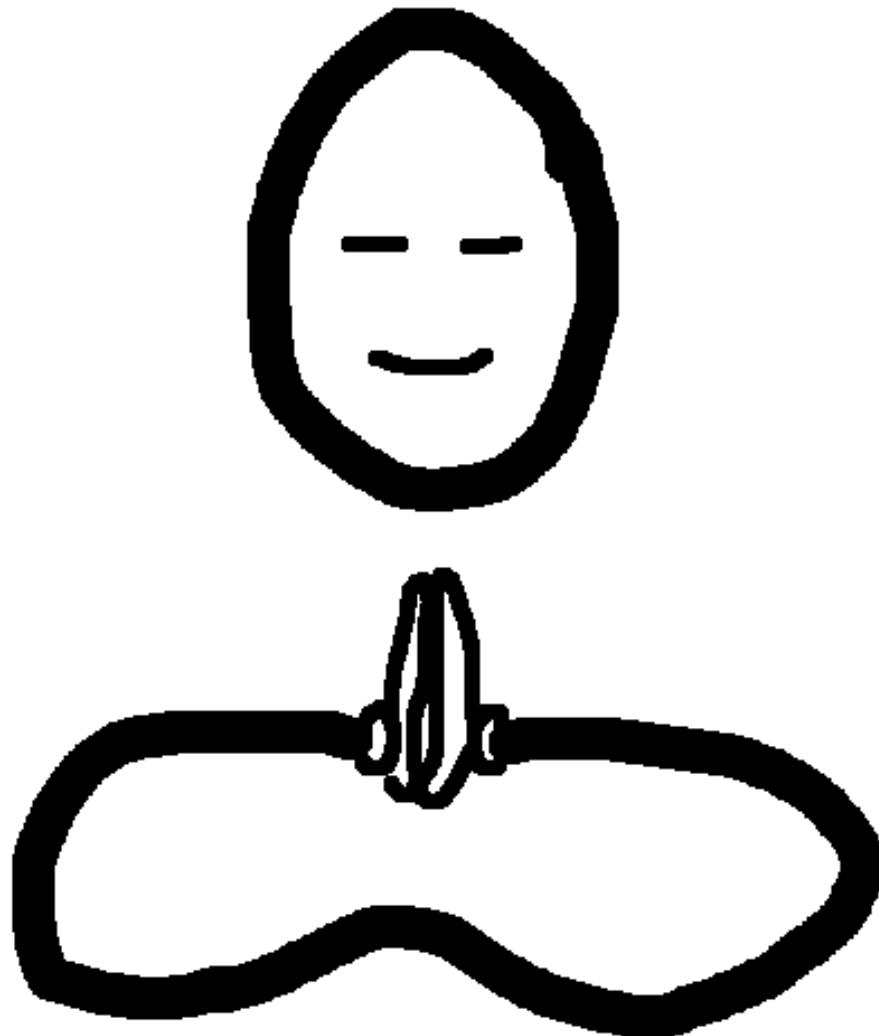

...

$$y^2 = x^3 + ax + b$$

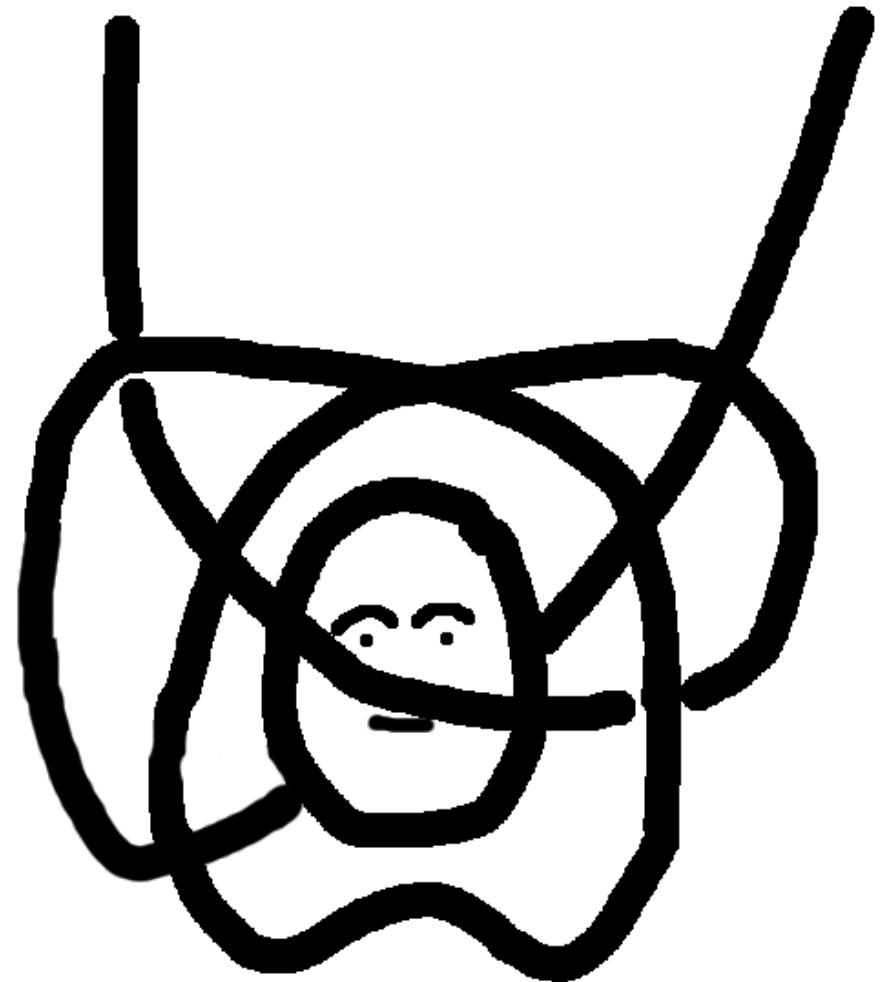

... elliptic has to reconsider its form ...

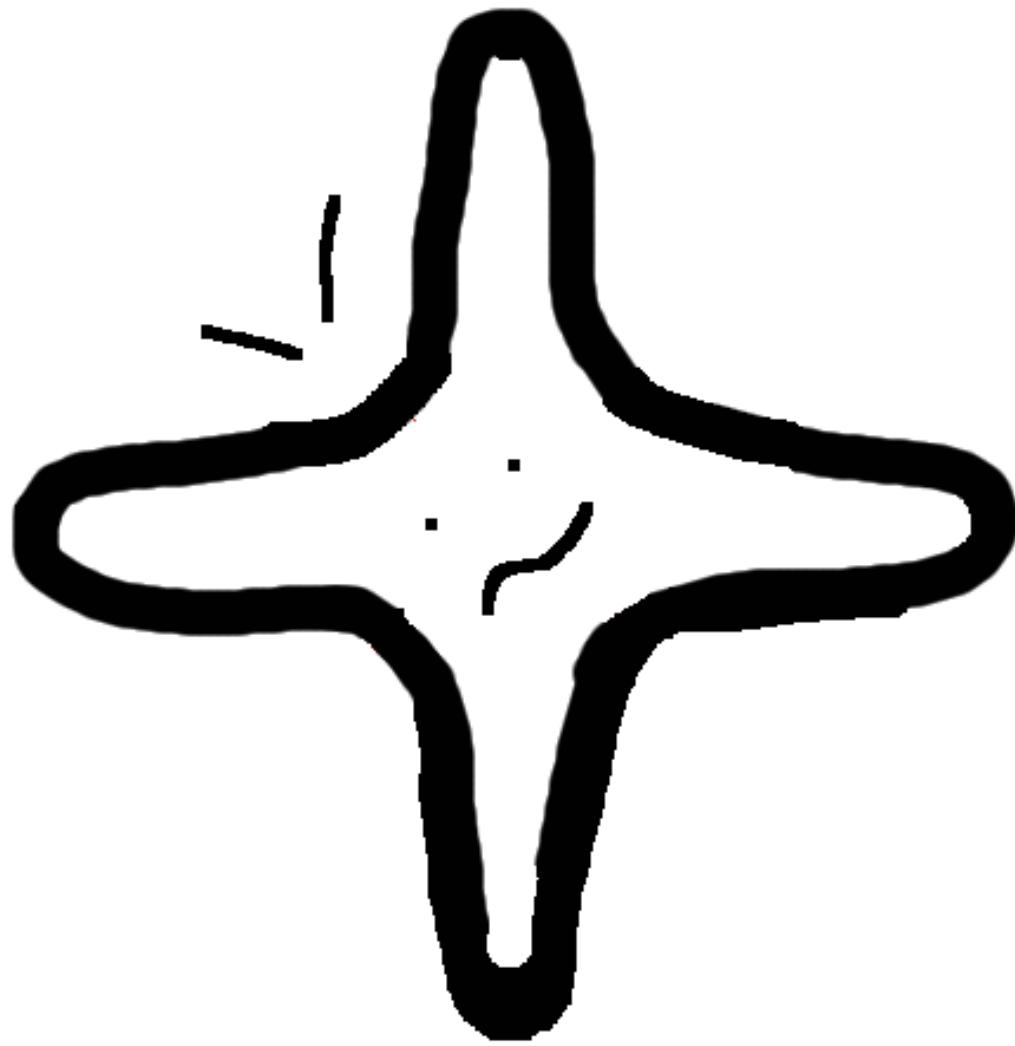

...has to abstract from its Weierstrass form

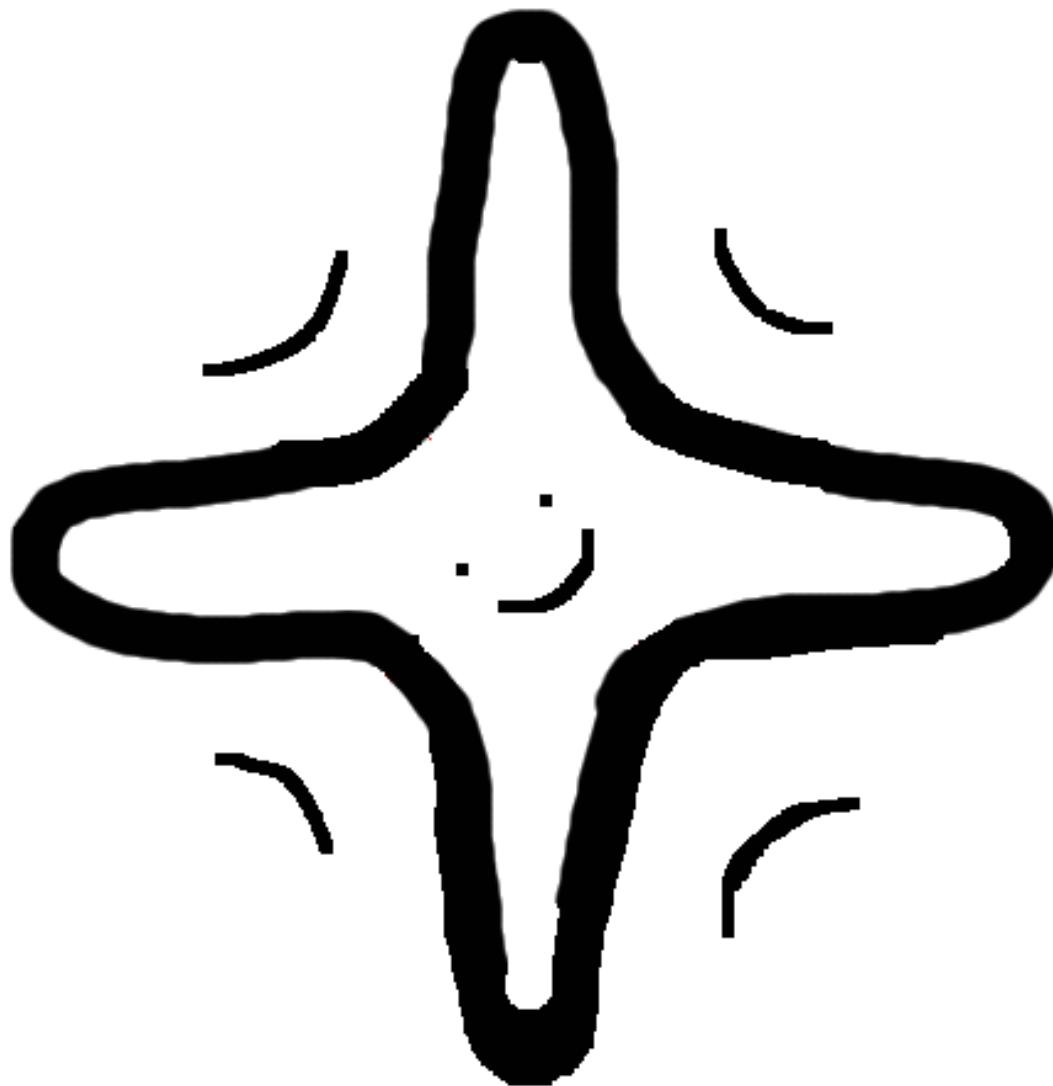

... has to undergo severe isomorphic transformations ...

...until it finds...

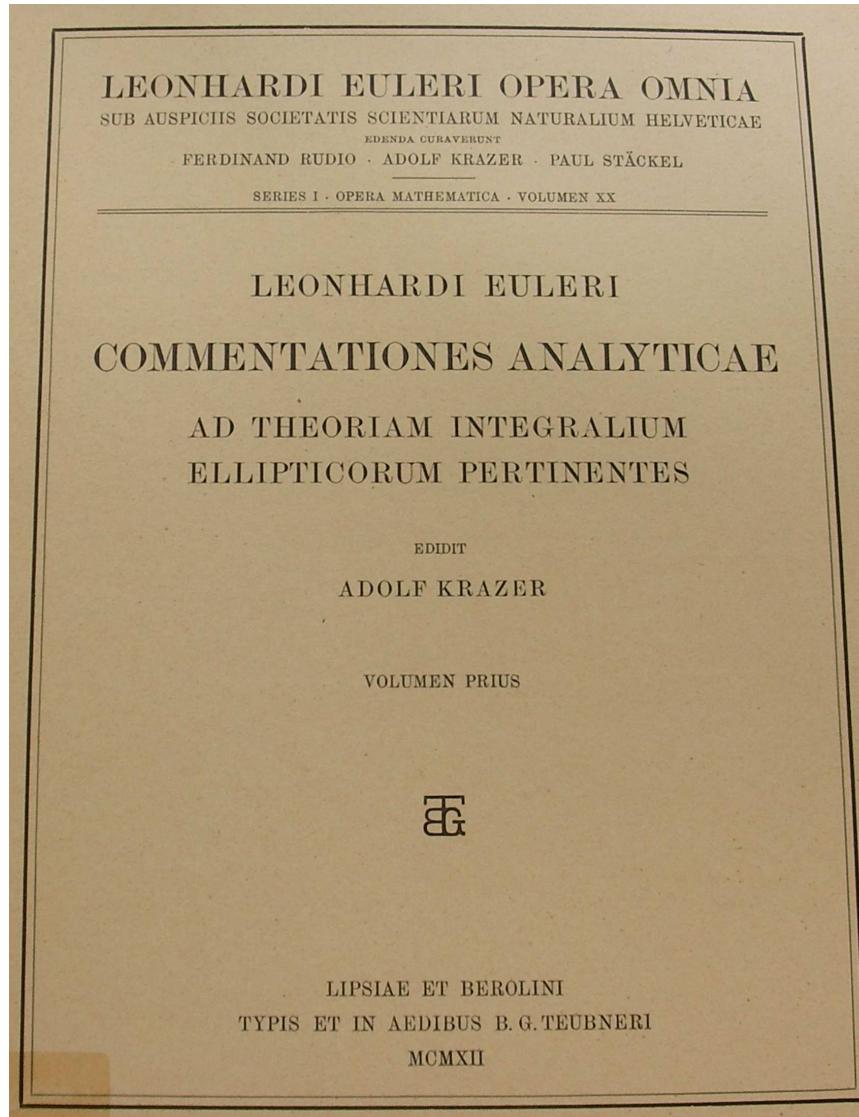

...its true ...

... normal form!

$$x^2 + y^2 = c(1 + dx^2y^2)$$

Long, long ago ...

Euler 1761

“Observationes de Comparatione Arcuum Curvarum Irrectificabilium”

I. DE ELLIPSI

1. Sit quadrans ellipticus ABC (Fig. 1), cuius centrum in C , eiusque semiaxes ponantur $CA=1$ et $CB=c$; sumta ergo abscissa quacunque $CP=x$ erit applicata ei respondens $PM=y=c\sqrt{1-xx}$; cuius differentiale cum sit $dy=-\frac{cxdx}{\sqrt{1-xx}}$, erit abscissae $CP=x$ arcus ellipticus respondens

$$BM = \int \frac{dx \sqrt{1-(1-cc)xx}}{\sqrt{1-xx}}.$$

Ponatur brevitatis gratia $1-cc=n$, ut sit arcus

$$BM = \int dx \sqrt{\frac{1-nxx}{1-xx}},$$

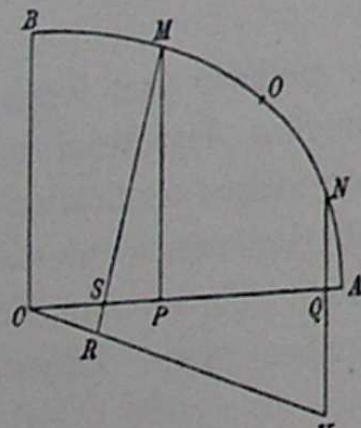

Fig. 1.

$$\frac{1}{y^2} = \frac{1-nx^2}{1-x^2} \Leftrightarrow x^2 + y^2 = 1 + nx^2 y^2.$$

Euler 1761

COROLLARIUM 3

43. Inventio ergo cordarum arcum quorumvis multiplorum una cum cordis complementi ita se habebit:

Corda arcus

$$\text{simpli} = a$$

$$\text{dupli} = b = \frac{2aA}{1 - aaAA}$$

$$\text{tripli} = c = \frac{aB + bA}{1 - abAB}$$

$$\text{quadrupli} = d = \frac{aC + cA}{1 - acAC}$$

$$\text{quintupli} = e = \frac{aD + dA}{1 - adAD}$$

etc.

Corda complementi

$$\text{simpli} = A$$

$$\text{dupli} = \frac{AA - aa}{1 + aaAA} = B$$

$$\text{tripli} = \frac{AB - ab}{1 + abAB} = C$$

$$\text{quadrupli} = \frac{AC - ac}{1 + acAC} = D$$

$$\text{quintupli} = \frac{AD - ad}{1 + adAD} = E$$

etc.

Euler gives doubling and (special) addition for (a, A) on
 $a^2 + A^2 = 1 - a^2 A^2$.

Gauss, posthumously

ELEGANTIORES INTEGRALIS $\int \frac{dx}{\sqrt{1-x^4}}$ PROPRIETATES.

[2.]

$$1 = ss + cc + sscc \quad \text{sive} \quad 2 = (1+ss)(1+cc) = (\frac{1}{ss}-1)(\frac{1}{cc}-1)$$
$$s = \sqrt{\frac{1-cc}{1+cc}}, \quad c = \sqrt{\frac{1-ss}{1+ss}}$$

$$\sin \text{lemn}(a \pm b) = \frac{sc' \mp s'c}{1 \mp scs'c'}$$

$$\cos \text{lemn}(a \pm b) = \frac{cc' \mp s's}{1 \pm ss'cc'}$$

$$\sin \text{lemn}(-a) = -\sin \text{lemn} a, \quad \cos \text{lemn}(-a) = \cos \text{lemn} a$$

$$\sin \text{lemn } k\varpi = 0$$

$$\sin \text{lemn}(k + \tfrac{1}{2})\varpi = \pm 1$$

$$\cos \text{lemn } k\varpi = \pm 1$$

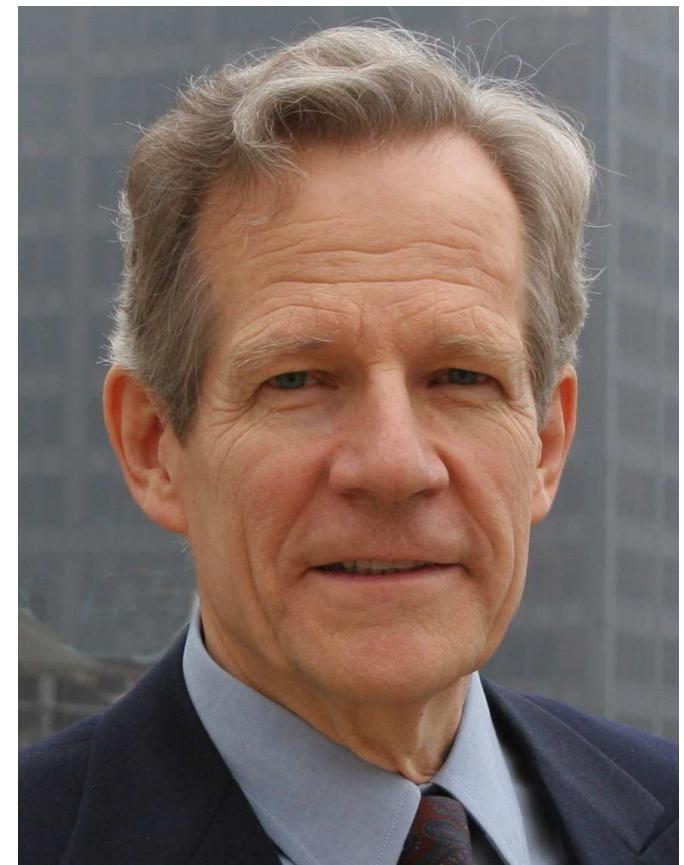

$$\cos \text{lemn}(k + \tfrac{1}{2})\varpi = 0$$

Gauss gives general addition for arbitrary points on

$$1 = s^2 + c^2 + s^2c^2.$$

Ex uno plura

- Harold M. Edwards, Bulletin of the AMS, 44, 393–422, 2007
 $x^2 + y^2 = a^2(1 + x^2y^2)$, $a^5 \neq a$ describes an elliptic curve over field k of odd characteristic.
- Every elliptic curve can be written in this form – over some extension field.
- Ur-elliptic curve
 $x^2 + y^2 = 1 - x^2y^2$
needs $\sqrt{-1} \in k$ transform.
- Edwards gives addition law for this generalized form, shows equivalence with Weierstrass form, proves addition law, gives theta parameterization ...

Elliptic geared for crypto

Introduce further parameter d to cover more curves over k

$$x^2 + y^2 = c^2(1 + dx^2y^2), \quad c, d \neq 0, dc^4 \neq 1.$$

- $P + Q = \left(\frac{x_P y_Q + y_P x_Q}{c(1 + dx_P x_Q y_P y_Q)}, \frac{y_P y_Q - x_P x_Q}{c(1 - dx_P x_Q y_P y_Q)} \right).$
- Neutral element is $(0, c)$, this is an **affine** point!
- $-(x_P, y_P) = (-x_P, y_P)$.

Elliptic geared for crypto

- Unified group operations!

Elliptic geared for crypto

Introduce further parameter d to cover more curves over k

$$x^2 + y^2 = c^2(1 + dx^2y^2), \quad c, d \neq 0, dc^4 \neq 1.$$

- $P + Q = \left(\frac{x_P y_Q + y_P x_Q}{c(1 + dx_P x_Q y_P y_Q)}, \frac{y_P y_Q - x_P x_Q}{c(1 - dx_P x_Q y_P y_Q)} \right).$

$$A = Z_P \cdot Z_Q; \quad B = A^2; \quad C = X_P \cdot X_Q; \quad D = Y_P \cdot Y_Q;$$

$$E = d \cdot C \cdot D; \quad F = B - E; \quad G = B + E;$$

$$X_{P+Q} = A \cdot F \cdot ((X_P + Y_P) \cdot (X_Q + Y_Q) - C - D);$$

$$Y_{P+Q} = A \cdot G \cdot (D - C); \quad Z_{P+Q} = c \cdot F \cdot G.$$

Elliptic geared for crypto

Introduce further parameter d to cover more curves over k

$$x^2 + y^2 = c^2(1 + dx^2y^2), \quad c, d \neq 0, dc^4 \neq 1.$$

- $P + Q = \left(\frac{x_P y_Q + y_P x_Q}{c(1 + dx_P x_Q y_P y_Q)}, \frac{y_P y_Q - x_P x_Q}{c(1 - dx_P x_Q y_P y_Q)} \right).$

$$A = Z_P \cdot Z_Q; \quad B = A^2; \quad C = X_P \cdot X_Q; \quad D = Y_P \cdot Y_Q;$$

$$E = d \cdot C \cdot D; \quad F = B - E; \quad G = B + E;$$

$$X_{P+Q} = A \cdot F \cdot ((X_P + Y_P) \cdot (X_Q + Y_Q) - C - D);$$

$$Y_{P+Q} = A \cdot G \cdot (D - C); \quad Z_{P+Q} = c \cdot F \cdot G.$$

Needs **10M + 1S + 1C + 1D + 7A**.

- At least one of c, d small: $x^2 + y^2 = c^2(1 + dx^2y^2)$ and $x^2 + y^2 = \bar{c}^2(1 + \bar{d}x^2y^2)$ isomorphic if $c^4d = \bar{c}^4\bar{d}$.
- $\bar{c}^4\bar{d} = (c^4d)^{-1}$ gives quadratic twist.

Unified? Unified!

- No exceptional cases? What if a denominator is zero?
- If d is not a square then Edwards addition law is **complete**: For $x_1^2 + y_1^2 = 1 + dx_1^2y_1^2$ and $x_2^2 + y_2^2 = 1 + dx_2^2y_2^2$ always $dx_1x_2y_1y_2 \neq \pm 1$.
Outline of proof:
If $(dx_1x_2y_1y_2)^2 = 1$ then $(x_1 + dx_1x_2y_1y_2y_1)^2 = dx_1^2y_1^2(x_2 + y_2)^2$. Conclude that d is a square. But d is not a square!
- If d is not a square then there is exactly one point of order 2 and two of order 4. Otherwise the full 2-torsion group is k -rational.
- Plane curve has 2 singular points at infinity; their blow-ups are defined over $k(\sqrt{d})$ and have order 2.

Fastest unified addition-or-doubling formul

System	Cost of unified addition-or-doubling
Projective	$11M+6S+1D$; see Brier/Joye '03
Projective if $a_4 = -1$	$13M+3S$; see Brier/Joye '02
Jacobi intersection	$13M+2S+1D$; see Liardet/Smart '01
Jacobi quartic	$10M+3S+1D$; see Billet/Joye '01
Hessian	$12M$; see Joye/Quisquater '01
Edwards ($c = 1$)	$10M+1S+1D$

- Exactly the same formulae for doubling (no re-arrangement like in Hessian where $2(X_1 : Y_1 : Z_1) = (Z_1 : X_1 : Y_1) + (Y_1 : Z_1 : X_1)$; no if-else)
- **No exceptional cases** if d is not a square. Formulae correct for all affine inputs (incl. $(0, c), P + (-P)$).

Spotlight on the transformation

Curve $x^2 + y^2 = c^2(1 + dx^2y^2)$ in Edwards form is birationally equivalent to curve

$$E : (1/e)v^2 = u^3 + (4/e - 2)u^2 + u$$

in Montgomery form, where $e = 1 - dc^4$.

Let $(x_1, y_1) + (x_2, y_2) = (x_3, y_3)$ on Edwards curve. Put

- $P_i = \infty$ if $(x_i, y_i) = (0, c)$;
- $P_i = (0, 0)$ if $(x_i, y_i) = (0, -c)$;
- $P_i = (u_i, v_i)$ if $x_i \neq 0$, where $u_i = (c + y_i)/(c - y_i)$ and $v_i = 2c(c + y_i)/(c - y_i)x_i$.

Then $P_i \in E(k)$ and $P_1 + P_2 = P_3$.
